

Protecting and improving the nation's health

Bedford

Unitary Authority

This profile was published on 6 September 2016

Health Profile 2016

Health in summary

The health of people in Bedford is varied compared with the England average. About 17% (5,500) of children live in low income families. Life expectancy for both men and women is higher than the England average.

Health inequalities

Life expectancy is 9.1 years lower for men and 10.4 years lower for women in the most deprived areas of Bedford than in the least deprived areas.

Child health

In Year 6, 18.6% (325) of children are classified as obese. The rate of alcohol-specific hospital stays among those under 18 was 22.7*, better than the average for England. This represents 8 stays per year. Levels of GCSE attainment are worse than the England average. Levels of breastfeeding initiation are better than the England average.

Adult health

The rate of alcohol-related harm hospital stays is 537*, better than the average for England. This represents 834 stays per year. The rate of self-harm hospital stays is 167.7*, better than the average for England. This represents 278 stays per year. The rate of smoking related deaths is 227*, better than the average for England. This represents 194 deaths per year. The rate of sexually transmitted infections is better than average.

Local priorities

Priorities in Bedford Borough are to improve health and reduce health inequalities by giving every child the best start in life, ensuring good mental health and wellbeing throughout life, and enabling people to live longer and healthier lives. For more information see www.bedford.gov.uk

* rate per 100,000 population

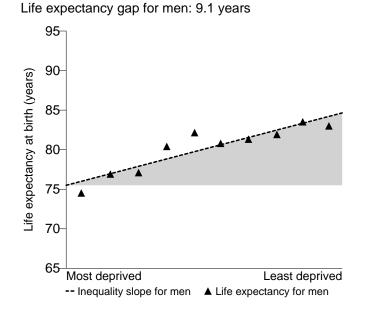

Deprivation: a national view

The map shows differences in deprivation in this area based on national comparisons, using quintiles (fifths) of the Index of Multiple Deprivation 2015 (IMD2015), shown by lower super output area. The darkest coloured areas are some of the most deprived neighbourhoods in England. This chart shows the percentage of the population who live in areas at each level of deprivation.

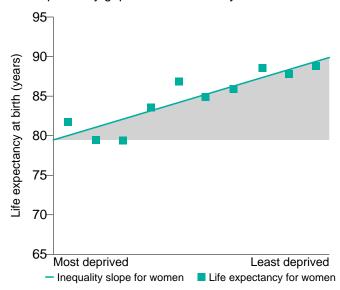

Life expectancy: inequalities in this local authority

The charts below show life expectancy for men and women in this local authority for 2012-2014. Each chart is divided into deciles (tenths) by deprivation (IMD2010), from the most deprived decile on the left of the chart to the least deprived decile on the right. The steepness of the slope represents the inequality in life expectancy that is related to deprivation in this local area. If there was no inequality in life expectancy as a result of deprivation, the line would be horizontal.

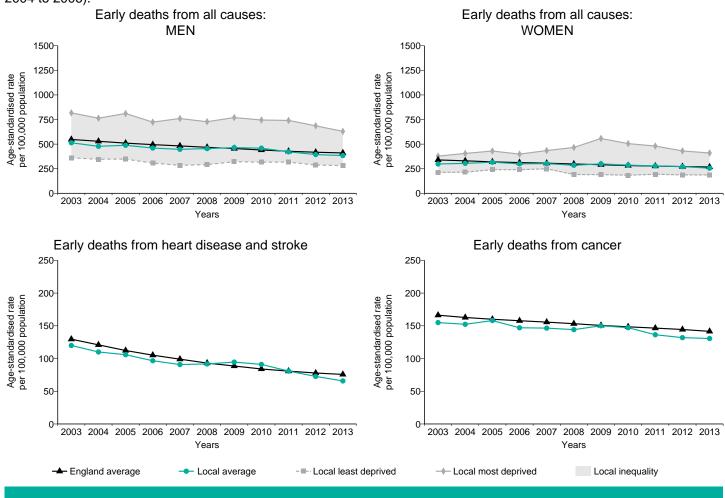

Life expectancy gap for women: 10.4 years

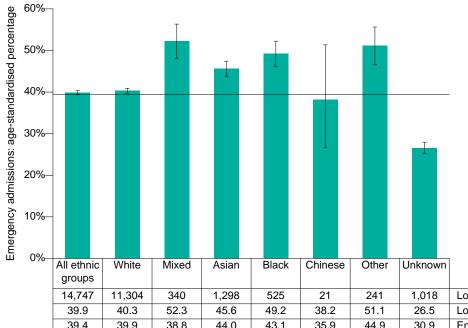

Health inequalities: changes over time

These charts provide a comparison of the changes in early death rates (in people under 75) between this area and all of England. Early deaths from all causes also show the differences between the most and least deprived quintile (IMD2010) in this area. (Data points are the midpoints of 3 year averages of annual rates, for example 2005 represents the period 2004 to 2006).

Health inequalities: ethnicity

This chart shows the percentage of hospital admissions for each ethnic group that were emergencies, rather than planned. A higher percentage of emergency admissions may be caused by higher levels of urgent need for hospital services or lower use of services in the community. Comparing percentages for each ethnic group may help identify inequalities.

Bedford

95% confidence interval

England average (all ethnic groups)

Figures based on small numbers of admissions have been suppressed to avoid any potential disclosure of information about individuals.

Health summary for Bedford

The chart below shows how the health of people in this area compares with the rest of England. This area's result for each indicator is shown as a circle. The average rate for England is shown by the black line, which is always at the centre of the chart. The range of results for all local areas in England is shown as a grey bar. A red circle means that this area is significantly worse than England for that indicator; however, a green circle may still indicate an important public health problem.
